

## Notes\_6

### Direct Proof of $P \Rightarrow Q$

1. Assume LHS is **T**
2. Argue RHS is **T**  
 $p \rightarrow q \equiv \neg q \rightarrow \neg p$

### Indirect Proof (By Contrapositive)

1. Assume RHS is **F**
2. Argue LHS is **F**

Therefore, both  $(p \text{ or } q) \oplus (p \wedge q)$  is **T**  $\wedge$   $\neg p$  is **T**. Then,  $P$  is **F**. Therefore,  $p \wedge q$  is **F**. Then  $p$  or  $q$  is **T**. Means  $q$  is **T** which means  $q$  is **T** since  $p$  is **F**. So the implication is valid.

Then  $p \wedge r$  is **T**. Therefore both  $p \wedge r$  are **T**. So,  $p$  or  $q$  is **T** (since  $p$  is **T**).  $(p \text{ or } q) \oplus (p \wedge r)$  is **F**. So LHS is **F**. So the implication is valid.

Assume LHS is **T**

1.  $p \text{ or } q$  **T**  $\wedge$   $(p \wedge r)$  **F**
2.  $p \text{ or } q$  | **T** |  $\wedge$   $p \wedge r$  | **F**

Both  $p$  or  $r$  is **T**  $\wedge$   $p \oplus q$  is **T**. Want to show  $q \rightarrow r$  is **T**. So assume  $q$  is **T**. Since  $p \oplus q$  is **T**,  $p$  is **F**. Since  $p$  or  $r$  is **T**, so  $r$  is **T** which is what we needed to show. So RHS is **T**.

| *Implication is Valid*

Assume RHS is **F**. So  $q \rightarrow r$  is **F**. means  $q$  is **T**  $\wedge$   $r$  is **F**.

1.  $p$  **T**: Since  $q$  is also **T**  $p \oplus q$  is **F** then LHS is **F**
2.  $p$  **F**: Since  $r$  is also **F**  $p$  or is also **F** LHS is **F**
